

**DBLOADER(1)**

**(dbloader 1.4)**

**DBLOADER(1)**

**NAME**

dbloader, dbunloader - generates "load/unload" statements

**SYNOPSIS**

dbloader -d dbname [-t tablename] [-e] [filename]  
dbunloader -d dbname [-t tablename] [-s [-l]] [-e] [filename]

**DESCRIPTION**

Dbloader will generate SQL "load" statements for Informix database tables. Dbunloader will generate SQL "unload" statements for Informix database tables. If the optional filename is not specified, stdout is used.

**OPTIONS**

- d database name
  
  - t table name
  
  - s generates additional SQL statements for shared table locking (dbunloader only)
  
  - l generates even more SQL statements for databases with transactions (available only with the -s option)
  
  - e explode the SQL statements to show all columns
- filename is the name of the file that the SQL statements go in

**NOTES**

Dbloader requires that an Informix database engine be installed on the machine running it.

If a table name is not specified, the entire database is used.

Wild-card characters may be used in the table name if desired.

**SUPPORT**
